                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stransed cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                            Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.
                                                                                                                                                                                                                                                                                                                                                                                                                      04-SEP-2003.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rattus

The present sequence is that of a 5' PCR primer, used with the 3' primer given in AAF30362, to amplify a cDNA fragment corresponding to nucleotides 904-172 of the human chfr sequence given in AAF30352. The chfr gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of Cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines \$M480, DLD1, HT29, HCT116, \$ASOS2, UZOS, IMFS and NGP. A mutation leading

Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs.

CC nucleic acids by isolation and hybridisation of nucleic acid pools, then comprise variable and non-variable regions. The capture oligonucleotides agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides comprises a sirable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3 'variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow that comprises a sequence of 10-50, particularly 15-25, T residues. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC interaction with streptavidin material and/or membrane, having semical particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC is particularly a layer of (bio)molecular filaments and binding of single extranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC is partity of pharmaceuticals and (i) for analysis of patterns, especially in mucosal, CC hair root, blood, nerve or germ cells and (ii) for determining the CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and call ows imaging of the complete sapid, inexpensive and reproducible call was imaging of the comparison of nucleic acid sfrom cells. It CC allows imaging the particular probable and comparison of nucleic acid pool. Since the CC are the comparison of such the nucleic acid pool. Since the CC are the comparison of such the nucleic acid pool. Since the comparison is possible. ADX01281-ADX01344 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 4

                                                                                   CC The present sequence is that of a 5' PCR primer, used with the 3' primer CC given in AAF30364, to amplify a cDNA fragment corresponding to CC nucleotides 904-1902 of the human chfr sequence given in AAF30352. The CC chfr gene encodes the human mitotic checkpoint protein Chfr (see CC AAB20219), which is required for regulation of the transition of Chfr is CC remover the control of the constitution of Chfr is CC associated with a predisposition to tumourigenesis upon exposure to CC mitotic stress. A set of primers (see AAF3033-76) was used to amplify CC regions spanning the entire chfr coding region in order to determine CC whether the chfr gene is mutated in any of the human cancer cell lines CC waf80, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading CC to a Val-580 to Met amino acid substitution was identified in the chfr Gene of U2OS cells. Chfr polypeptides and chfr nucleic acids are used in CC methods of diagnosing tumourigenic cells and of screening for drugs which CC can inhibit the activity of Chfr in a cancer cell, rendering it more CC sensitive to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ន្តន្តន្ត
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁

```
The present sequence is that of a 3' PCR primer, used with the 5' primer CC given in AAF30353, to amplify a cDNA fragment corresponding to nucleotides 66-562 of the human entry sequence given in AAF30352. The chfr Cg gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), CC which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated CC with a predisposition to tumourigenesis upon exposure to mitotic stress. CA set of primers (see AAF30353.76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines Sw440, DLDI, HT29, CC HCT116, SAOS2, U2OS, IMRS and NGP. A mutation leading to a Val-580 to Met CC chfr polypeptides and chfr nucleic acids are used in methods of CC chfrosting tumourigenic cells and of screening for drugs which can consisting tumourigenic cells and of screening for drugs which can cancer cell, rendering it more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S

                                                                                                                                                                                                                                                                                                  ş
                                                                                                                                                                                                                                                                                                                                                                                                        CC The present sequence is that of a 5' PCR primer, used with the 3' primer CC given in AAF30360, to amplify a cDNA fragment corresponding to nucleotides 904-1753 of the human chfr sequence given in AAF30352. The CC nucleotides 904-1753 of the human chfr sequence given in AAF30352. The CC chir gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to associated with a predisposition to tumourigenesis upon exposure to creditoric stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of U2OS cells. Chfr polypeptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ filles AAQ755978) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

```

A method for the analysis of cDNA comprises (a) double-stranded cDNAs by using an aggregate of

mRNAs and a plural type

စ္ကန္

```

                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

Comprise variable and non-variable region. The complement of which is present at CC have a 5'-invariable anchor region, the complement of which is present at CC that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC capture oligonucleotides are biotinnylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface by interaction with streptavidin. The material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single crystacl, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the captures. The method provides rapid, inexpensive and reproducible acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible captures in again of the complete pattern of all nucleic acids from cells. It captures is based on comparison of nucleic acid pools, not individual represent the method is based on comparison is possible. ADK01281-ADK01344 represent components and nucleic acid sold in a cell, and capture probes used in the method of the invention.

                                                                                                                                         This invention describes a novel method for sorting single-stranded conucleic acids by isolation and hybridisation of nucleic acid pools, then care calding out, where the nucleic acids are selectively bound using capture comparise that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region comprises once in each nucleic acid and a 3'-variable, discriminatory region comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides to allow binding of particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, complete acids to the surface is (quasi) covalent, suprample collar, ghysical, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramplecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (anion, carboxylic or fatty acid) or their derivatives, salts and conjusted in the mothod of the invention. Since the capture probes used on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADKO1381-ADKO1344 represent comparison of nucleic acid pools, and individual in the method of t

                             Comprise variable and non-variable regions. The capture oligonucleotides comprise variable and non-variable regions. The capture oligonucleotides comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at compare once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The computed on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, comparticularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, comparticularly an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cardivity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and cardivity of patterns of a comparison of a comparison of all nucleic acids from cells. It can detect very small differences in the nucleic acids from cells, and can detect very small differences in the nucleic acid pool. Since the comparison of nucleic acid pools, not individual capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       멼
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ADK01310/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example; Page 5; 8pp; German

cc nucleic acids by isolation and hybridisation of nucleic acid pools, then comprise that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprise variable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow that comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, aciditives or supplements, especially minerals, trace elements, organic aciditives or supplements, especially minerals, trace elements, organic aciditives in aciditives, salts and compunity of pharmaceuticals and/or nutritional compounds, e.g. food cativity of pharmaceuticals and/or nutritional compounds. E.g. food cativity of physical cativity of physical cativity of p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ADK01336/c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 14

                  chir gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30333-76) was used to amplify regions spanning the entire chfr coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, UZOS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of UZOS cells. Chfr polypeptides and chfr mucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more sensitive to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                               Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs.
                                                                                                                                                                                                                                   nucleotides 352-1055 of the human chfr sequence given in AAF30352.
                                                                                                                                                                                                                                                   The present sequence is that of a 5' PCR primer, used with tgiven in AAF30356, to amplify a cDNA fragment corresponding

                                                                                                                                                                                                                                                              associated with a predisposition to tumourigenesis upon exposure to mitotic stress. A set of primers (see AAF30353-76) was used to amplify regions spanning the entire cofir coding region in order to determine whether the chfr gene is mutated in any of the human cancer cell lines SW480, DLD1, HT29, HCT116, SAOS2, U2OS, IMR5 and NGP. A mutation leading to a Val-580 to Met amino acid substitution was identified in the chfr gene of U2OS cells. Chfr polypeptides and chfr nucleic acids are used in methods of diagnosing tumourigenic cells and of screening for drugs which can inhibit the activity of Chfr in a cancer cell, rendering it more sensitive to additional antitumour therapies
                                                                                                                                                                                                                                                                                                                                                                                                                         given in AAR30355, to amplify a cDNA fragment corresponding to nucleotides 352-1055 of the human chfr sequence given in AAR30352. The chfr gene encodes the human mitotic checkpoint protein Chfr (see AAB20219), which is required for regulation of the transition of cells from prophase to metaphase during mitosis. Loss of expression of Chfr is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid sequence of mitotic checkpoint gene encoding a checkpoint with forkhead-associated domain and ring finger protein, diagnosing tumorigenic cells and in screening for anticancer drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Checkpoint with forkhead associated domain and ring finger; Chfr; human; mitosis; cell cycle; tumour; diagnosis; antitumour; drug screening; ubiquitin-protein ligase; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ83938, AAQ83952 and AAQ83940 are used in the CC construction of an oligonucleotide clamp. The clamp is a comb-type CC branched polymer which has 3' termini and was used to bind a target CC sequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. An oligonucleotide clamp is a compound capable of forming a covalently closed macromolecule or a stable circular complex after specifically binding to the target polymucleotide. Oligonucleotide clamps generally comprise one or more oligonucleotide moieties capable of specific binding to the target molecule and one or conceptairs of binding moieties covalently linked to the oligonucleotide moieties. Upon annealing of the oligonucleotides moieties to the target plymucleotide, the binding moieties of a pair are bought into correct pairs of the interaction of the binding moieties effectively clamps the specifically annealed oligonucleotide moieties to the target the specifically annealed oligonucleotide moieties to the target polymucleotide. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                         01-NOV-1994.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprise signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The present sequence is an OC used in the present invention
                                                                                                                                                  JP06303997-A
                                                                                                                                                                           Synthetic.
                                                                                                                                                                                                                                Reverse transcription primer used in cDNA analysis technique.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes. The electrophoresing the digested aggregate of cDNAs in separate lanes.

AAT04915-T04922 are oligonuclectide primers and probes used for the camplification and sequencing of mammalian stem cell factor (SCF). Non-care amplification and sequencing of mammalian stem cell factor (SCF). Non-care amplification occurring SCF and C-terminally truncated polypeptides, having a common acid sequences sufficiently duplicative of naturally occurring SCF, composition cells and primordial germ stem cells. The progenitor cells, neural stem cells and primordial germ stem cells. The composition for treating leucopenia, anaemia or cells composition for treating leucopenia, anaemia or cells composition composition for treating leucopenia, anaemia or cells composition composition. They can also cells used for treating neoplasia, nerve damage, infertility, intestinal cells used for treating neoplasia, nerve damage, infertility, intestinal cells peptides for use in detection or neutralisation of SCF in serum. SCF cells peptides for use in detection or neutralisation of SCF in serum. SCF cells be useful for the treatment of AIDS and severe combined cells immunodeficiency (SCID) states alone or in combination with other factors such as IL-7. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     administration to a subject. The method comprises: (a) obtaining CC haematopoietic progenitor cells from a donor; and (b) expanding the cells by adding to the cells a haematopoietically effective dose of a CC polypsptide product having at least part of the primary structural CC confirmation and one or more of the biological properties of naturally occurring stem cell factor (SCF). The method is useful for stimulating CC primitive progenitor cells including early haematopoietic progenitor CC granulocyte, lymphocyte and macrophage cells. SCF results in absolute CC increases in haematopoietic cells of both myeloid and lymphoid lineages. CC cris useful for treating haematopoietic disorders. The method is useful CC for expanding early haematopoietic progenitors in syngeneic, allogeneic CC or autiologous bone marrow transplant. SCF is useful for enhancing the CC cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is also useful for combating the myelosuppressive effects of cells. SCF is also useful for combating the myelosuppressive effects of canti-HIV drugs such as AZT and for enhancing haematopoietic recovery canti-HIV drugs such as AZT and for enhancing haematopoietic recovery complasia (cancer). Exposure of SCF to (II) results in increased uptake of (I) into the cell. The method is useful for enhancing the efficiency of the transfer of a polynucleotide into a target mammalian cell in vitro. The method is useful in gene therapy techniques. AAH41301 to AAH41364 and AAB98351 to AAB98390 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              blood
The present sequence for universal PCR primer 220-3 is 1 of 8 universal oligonucleotides (AASO4110-AASO4117) used in the isolation of the human SCF (stem cell factor) cDNA sequence. The present invention relates to novel stem cell factors (AAU02453-AAU02458, AAU02460, AAU02461) and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polynucleotides encoding them. SCF stimulate primitive progenitor cells including early haematopoietic progenitor cells. The invention also describes SCF peptides (AAU02467-AAU02481) and the oligonucleotides (AAS04081-AAS04117) used in the isolation of human and rat SCF sequences. The polynucleotide encoding SCF is useful for producing SCF and useful in gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, disseminated fungus disease, Pulminating septicemia, malaria, vitamin B12 and folic acid deficiency, pyridoxine deficiency, and hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                          Novel isolated non-human mammalian stem cell factor polypeptide stimulating growth of early hematopoietic progenitor cells, useful fo treating aplastic anemia, lymphoma, Letterer-Siwe disease, Kala azar,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; rat; mammal; stem cell factor; SCF; cell growth stimulation; gene therapy; haematopoietic disorder; aplastic anaemia; leukaemia; neurological damage; intestinal damage; infertility; AIDS; SCID; severe combined immunodeficiency; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Local

The present invention provides the protein and coding sequences of mammalian stem cell factors (SCFs). These are capable of stimulating to growth of early haematopoietic progenitor cells, neural stem cells and primordial germ stem cells. The sequences are useful in the treatment leukaemias, haematopoietic disorders, aplastic anaemia, paroxysmal nocturnal haemoglobinuria, malaria, pigmentation disorders, neurologic and intestinal damage, infertility, AIDS and severe combined

neurological

The present sequence for universal PCR primer 220-3 is 1 of 8 universal CC oligonucleotides (AAH23888-AAH23895) used in the isolation of the human CS CF (stem cell factor) cDNA sequence. The present invention relates to CC novel stem cell factors (AAB73561-AAB73568) AAB73571-AAB73576) and the CC including early haematopoletic progenitor cells. The invention also CC including early haematopoletic progenitor cells. The invention also CC describes SCF peptides (AAB73578-AAB73597) and the oligonucleotides CC (AAH23859-AAH23887) used in the isolation of human and rat SCF sequences. CC The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells CC such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple CC congestive splenomegaly, Kala azar, sarcoidosis, military tuberculosis, CC disseminated fungus disease, lymphoma, Gaucher's disease, anaemia, CC disseminated fungus disease, pulminating septicaemia, malaria, vitamin CC and folic acid deficiency, pyridoxine deficiency, and CC hypopigmentation disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁

CC The present sequence for universal PCR primer 220-3 is 1 of 8 universal CC oligonucleotides (AASO4211-AASO4218) used in the isolation of the human CC SCF (stem cell factor) cDNA sequence. The present invention relates to CC novel stem cell factors (AAU02761-AAU02767, AAU027797) and the polynucleotides encoding them. SCF stimulate primitive progenitor CC cells including early haematopoletic progenitor cells. The invention also CC cells including early haematopoletic progenitor cells. The invention also CC (AASO4182-AASO4210) used in the isolation of human and rat SCF sequences. CC The polynucleotide encoding SCF is useful for producing SCF and useful in CC gene therapy. It is useful for treating disorders involving blood cells such as myelofibrosis, metastatic carcinoma, acute leukaemia, multiple CC unyeloma, Hodgkin's disease, lymphoma, Gaucher's disease, anaemia, CC disseminated fungus disease, Plymphoma, Gaucher's disease, anaemia, CC disseminated fungus disease, Fulminating septicemia, malaria, vitamin B12 CC and folic acid deficiency, pyridoxine deficiency, and hypopigmentation CC disorders such as piebaldism and vitiligo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S

                                                                           The present sequence for universal PCR primer 220-3 is 1 of 19 PCR primers (AAS10435-AAS10435) used to amplify various portions of the human SCF cDNA sequence. The sequence is described in an invention relating to novel stem cell factors, the polynucleotides encoding them and methods for producing the stem cell factors. The methods involve increasing the number of early haematopoietic progenitor cells in human peripheral blood by administering a haematopoietically effective human stem cell factor polypeptide. The methods are useful for the treatment of blood disorders, including myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann-Pick disease, refractory anaemia, malaria, vitamin B12 and folt acid deficiency, hypopigmentation disorders i.e. piebaldism and viral induced disorders, including AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; stem cell factor; SCF; haematopoietic progenitor cell; blood disorder; Hodgkin's disease; vitamin B12; folic acid deficiency; hypopigmentation disorder; viral disorder; AIDS; PCR primer; ss.

AIDS;

Novel non-naturally-occurring stem cell factor polypeptide, useful treating leucopenia, thrombocytopenia, anemia and for enhancing engraftment of bone marrow during transplantation in a mammal.

Example 3; Fig 12C; 217pp; English.

The present invention relates to novel non-naturally-occurring stem cell CC factor (SCF) polypeptides having an amino acid sequence sufficiently CC duplicative of that of naturally-occurring SCF to allow possession of CC haematopoietic biological activity of naturally occurring SCF. Sequences CC of the invention are useful for treating leucopaenia, thrombocytopaenia, CC anaemia and for enhancing bone marrow accovery in treatment of radiation, CC engraftment of bone marrow during transplantation in mammals and chemical CC or chemotherapeutic induced bone marrow aplasia or myelosuppression. They are also useful for treating acquired immune deficiency in a human, nerve CC damage, neoplasia, infertility, myeloproliferative disorder, intestinal CC damage in a mammal. SCF sequences are useful for preparing biologically CC active polymer polypeptide adduct, for enhancing transfection of early CC active polymer polypeptide adduct, for enhancing transfection of early CC amammal. They are useful for treating myelofibrosis, myelosclerosis, CC Hodgkin's disease, lymphoma, Gaucher's disease, netastatic carcinoma, acute leukaemia, multiple myeloma, CC Hodgkin's disease, refractory erythroblastic anaemia, Di Guglielmo CC syndrome, congestive splenomegaly, Kala azar, sarcoidosis, primary CC tuberculosis, Fulminating capticated fungus disease, malaria, military of tuberculosis, myelosclerosis, disseminated fungus disease, malaria, military vitamin Bl2 splenic pancytopaenia, disseminated fungus disease, maiaria, williary tuberculosis, Fulminating septicaemia, pyridoxine deficiency, vitamin and folic acid deficiency, Diamond Blackfan anaemia, hypopigmentation disorders such as piebaldism, AIDS (acquired immune deficiency syndrom B12

                              polynucleotide sequences encoding the SCFs, and methods of producing them. SCFs are involved in the blood-forming (haematopoietic) system in mammals, particularly humans. The method of the invention is useful for the production of human SCF. The stem cell factors are useful to treat disorders involving blood cells e.g. metastatic carcinoma, acute leukaemia, multiple myeloma, Hodgkin's disease, lymphoma, refractory erythroblastic anaemia, miliary tuberculosis, disseminated fungus universal oligonucleotide for SCF DNA is used in the examples of the

CC haematopoietic activity and the polynucleotides encoding them. The CC haematopoietic activity and the polynucleotides encoding them. The CC polypeptides are used for treating infertility, intestinal damage, myeloproliferative disorders, leucopenia, thrombocytopenia or anaemia, cfor improving engraftment of bone marrow transplants, for enhancing bone marrow recovery after radiotherapy or chemotherapy and in treatment of carcinoma, leukaemia and military tuberculosis. The SCF polypeptides are also used to expand haematopoietic progenitor cells for transplantation and to prepare such cells for transfection with a gene. The SCF polypeptides and also as probes for mapping of the SCF gene, for identifying SCF-related diseases and as a marker for neighbouring genes. Antibodies raised against the polypeptides are useful in diagnosis and to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                         comprising oligonuclectides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                   Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                         WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory disease; pulmonary vasoconstriction;
          analgesic, hypotensive, immunosuppressive and cytostatic activity, beta-adrenergic agonist. The composition is useful for preventing c treating a respiratory, lung or malignant disease. The administered
                                                                                                                                                                                                                                                   This invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AI092623-derived oligonucleotide SEQ ID 3860.

        to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                  The invention
                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisense oligonucleotide; glucocorticoid receptor; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human glucocorticoid receptor-specific antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20-MAY-2002;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20-MAY-2003; 2003WO-US016084.

                                                                                                                           The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                     Sequence
                                                                                                                                                                                                                                                                          New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obcardiovascular disorder, hyperlipidemia or Cushing's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                             20-MAY-2002; 2002US-0381857P.

                                                                                                                                                                                                                                                                                                                                                                                                                          connected acid molecule encoding Navl.3, where the antisense compound connected acid molecule encoding Navl.3, where the antisense compound connected acid molecule encoding Navl.3, where the antisense compound connected with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition consociated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuroplay, chronic pain, lower back pain, confidence of the disease or condition consucrated acid from burns, migraine headache, cluster headache, mild-to-moderate confidence pain from burns, migraine headache, cluster headache, mild-to-moderate consorted but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with confidence represents a chimeric phosphorothicate oligonucleotide with confidence not infantile epilepsy; or ataxia. The present confidence represents a chimeric phosphorothicate oligonucleotide with confidence and a decoxy gap. Used during the antisense inhibition of thuman Navl.3 expression, the oligonucleotides are designed to target confidence and the present confidence of the human Navl.3 RNA.
                                                                                                                                                                                                                                                                        밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with 2,MOE wings and a deoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target
